

AP Emergence Pro- Combines APSBF+I along with a seed inoculant and a seed finisher. Early season planted soybeans will benefit from AP Emergence Pro by locking in the vigor to ensure a great start to the soybeans life cycle. Enhance yield by providing protection to young seedling roots with yield robbing diseases such as Pythium, phytophthora, fusarium, and rhizoctonia. Combining an insecticide will protect against above ground growth by early season insects. The addition of an Inoculant will set season long nodules to ensure satisfactory soybean yields.

Soybeans start to set nodules as early as V3 and rely heavily on nodules during pod fill. Without good nodule set your soybeans will not be able to convert atmospheric nitrogen to ammonium, a form of nitrogen available to the plant. Water logged soils for long periods of time will suffocate the needed bacteria that infect roots to start the formation of nodules, AP Emergence PRO provides inoculation to ensure good nodule set.

AP Emergence Pro also comes with a seed finisher. Seed finishers will help your seed with plantability and dust off.
