EnRich

Don't let Glyphosate Reduce your Soybean Yields! Use **EnRich** in all your Glyphosate Tank Mixes

Why Should **EnRich** be used in Glyphosate Tank Mixes?

- ✓ In the presence of non-chelated micronutrients, Glyphosate activity is reduced because it reacts with the nutrient. **EnRich** uses EDTA chelates to prevent this from occurring.
- ✓ Once Glyphosate enters the soybean and is exuded through the roots, micronutrients can be complexed and rendered temporarily unavailable to the plant. **EnRich's** package of carboxylates help to reduce this effect.
- ✓ **EnRich** contains essential micronutrients for soybean production, such as molybdenum which is essential in supporting the plants ability to fix and reduce nitrogen to an available form.

EnRich

Your First Choice to Improve Soybean Yields!

Enhance Crop Performance – use Harvey's **EnRich**
