

GroStim®

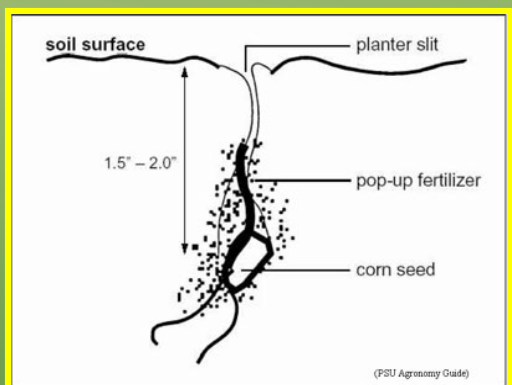

Harvey's
SEEDING PROGRESS SINCE 1871

AP PRODUCTS

For pop-up, starter, side and top dressing and foliar uses on corn, cotton and other crops

Higher fertilizer prices combined with favorable crop prices require growers to be more efficient with fertilizer applications but, at the same time, use good production practices to strive for high yields.

GroStim can be placed directly upon the seed. It is highly effective when crops are planted under cold or other adverse growing conditions. Early season foliar sprays of **GroStim**, after seedlings emerge, can also be an effective means of promoting root development and seedling vigor. **GroStim** can be combined with liquid fertilizer solutions or impregnated on dry fertilizer for applications at preplanting or top (or side) dressing .

GroStim was designed to supply a source of nutrients along with carboxylates to promote vigor and growth as the seed germinates and shoots emerge. Carboxylates are especially beneficial during adverse conditions when microbial activity is slow.

Enhance Crop Performance – use Harvey's **GroStim**
